

Machine-Level Programming III: Procedures

adapted for CS367@GMU

Mechanisms in Procedures

■ Passing control

- To beginning of procedure code
- Back to return point

■ Passing data

- Procedure arguments
- Return value

■ Memory management

- Allocate during procedure execution
- Deallocate upon return

■ Mechanisms all implemented with machine instructions

■ x86-64 implementation of a procedure uses only those mechanisms required

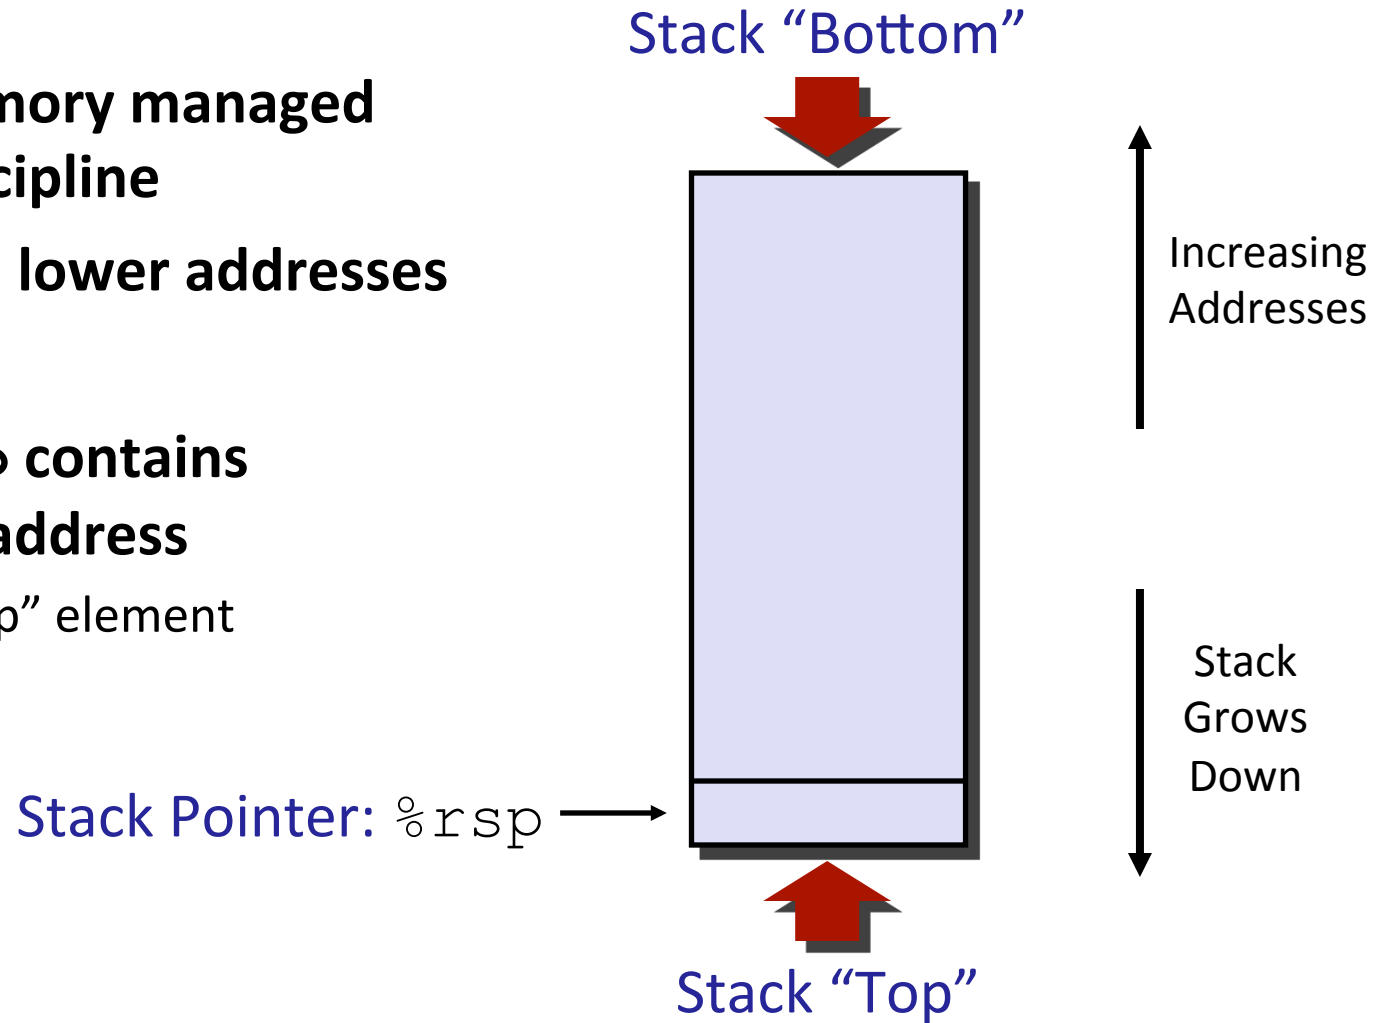

Today

■ Procedures

- **Stack Structure**
- **Calling Conventions**
 - Passing control
 - Passing data
 - Managing local data
- **Illustration of Recursion**

x86-64 Stack

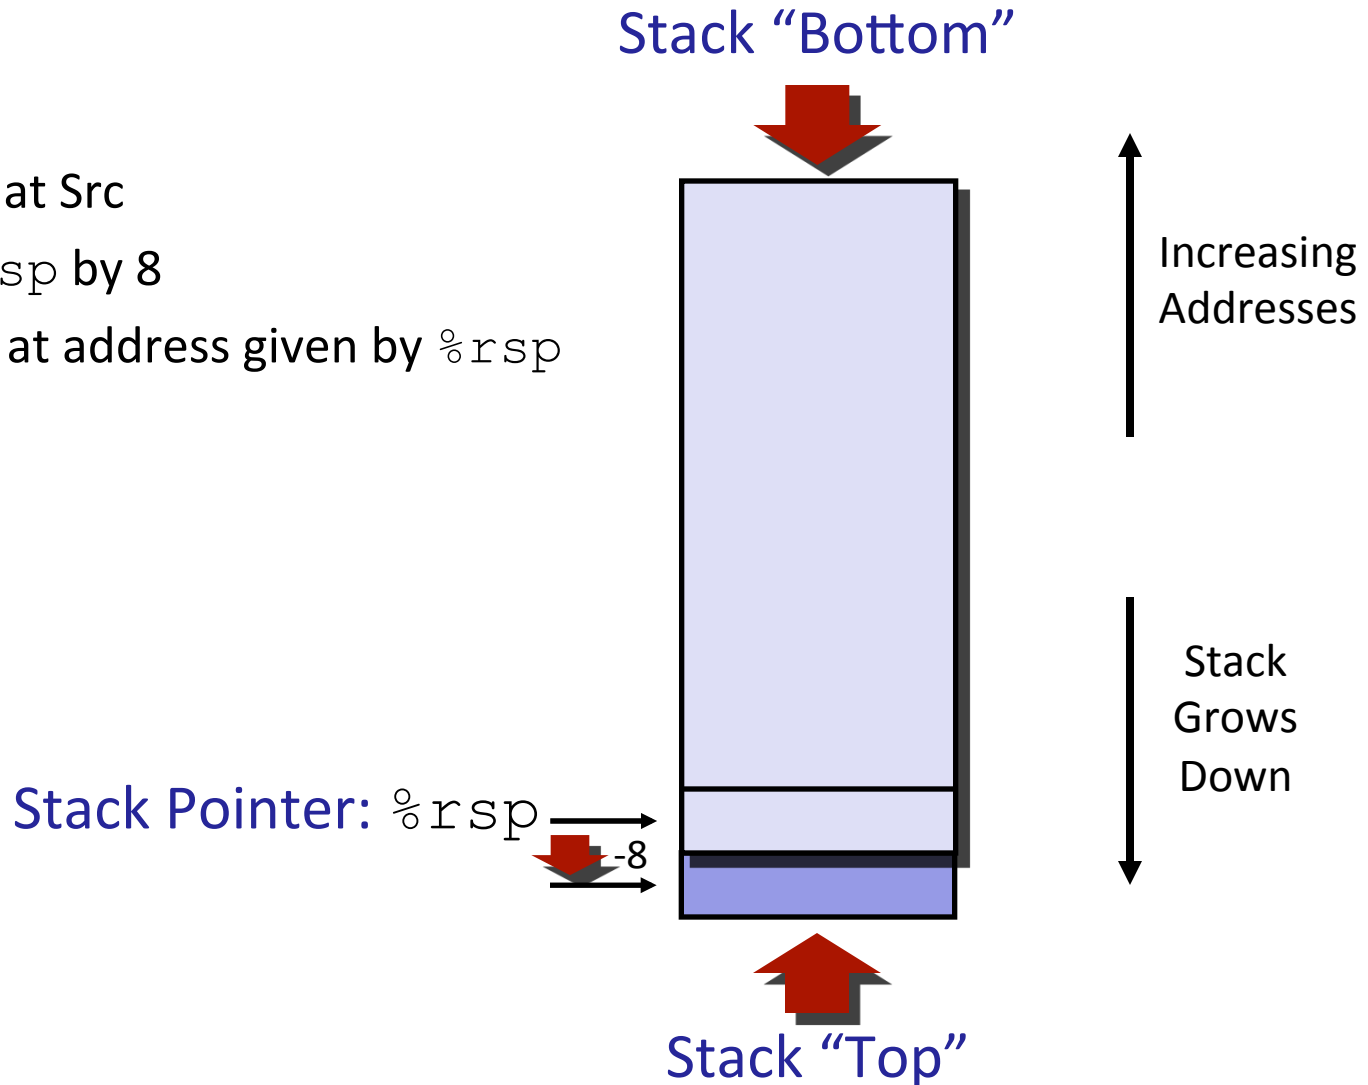

- Region of memory managed with stack discipline
- Grows toward lower addresses
- Register `%rsp` contains lowest stack address
 - address of “top” element

x86-64 Stack: Push

■ `pushq Src`

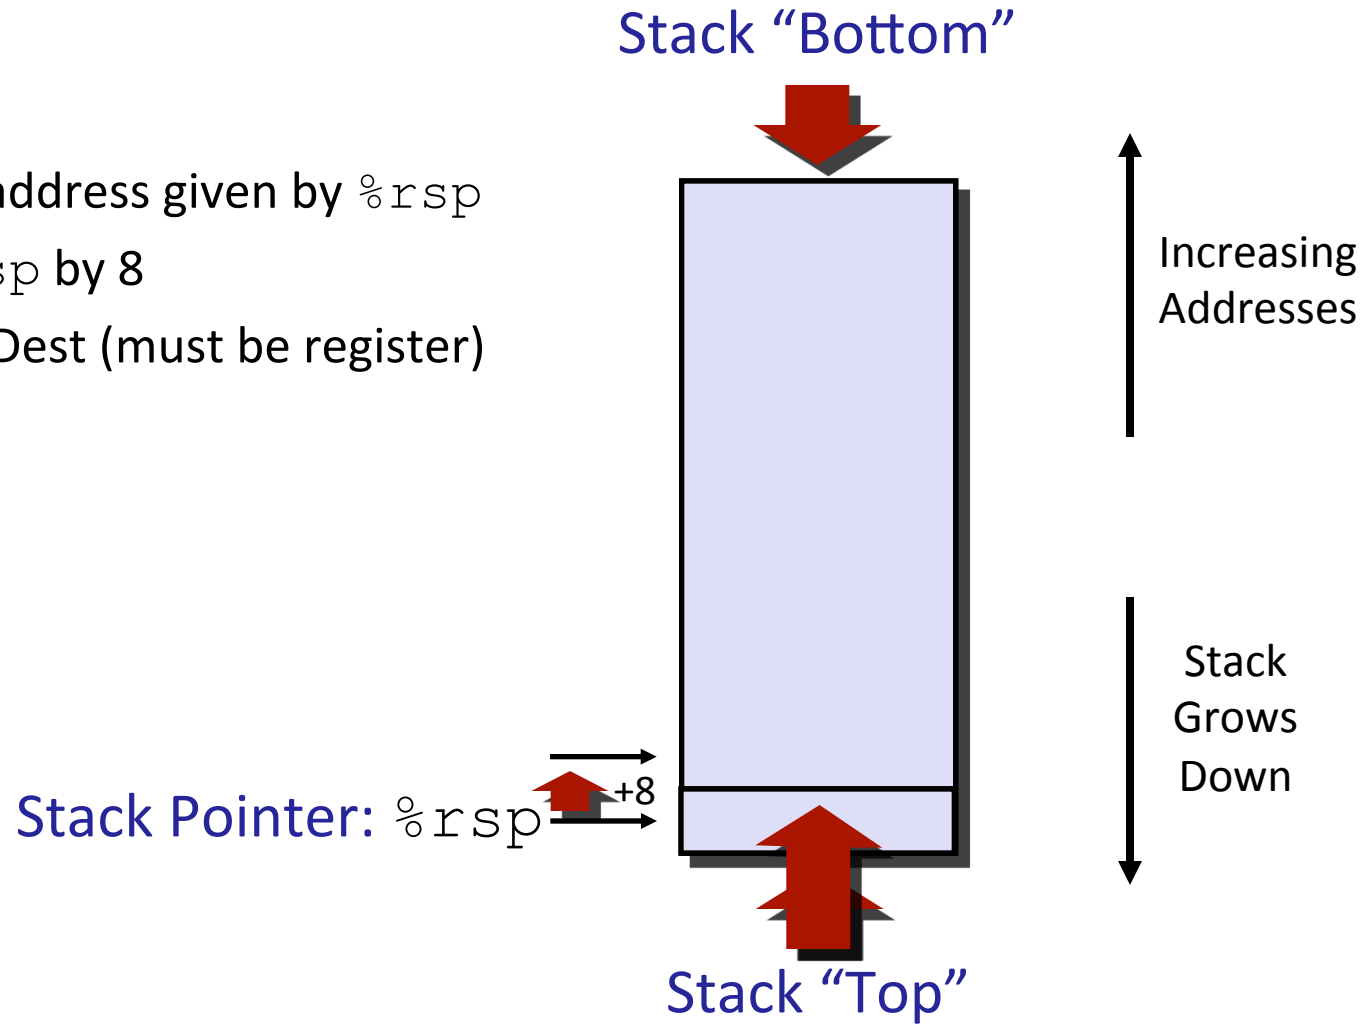

- Fetch operand at Src
- Decrement `%rsp` by 8
- Write operand at address given by `%rsp`

x86-64 Stack: Pop

■ `popq Dest`

- Read value at address given by `%rsp`
- Increment `%rsp` by 8
- Store value at `Dest` (must be register)

Today

■ Procedures

- Stack Structure
- Calling Conventions
 - **Passing control**
 - Passing data
 - Managing local data
- Illustration of Recursion

Code Examples

```
void multstore
(long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

```
00000000000400540 <multstore>:
 400540: push    %rbx                # Save %rbx
 400541: mov     %rdx,%rbx           # Save dest
 400544: callq   400550 <mult2>      # mult2(x,y)
 400549: mov     %rax, (%rbx)         # Save at dest
 40054c: pop     %rbx                # Restore %rbx
 40054d: retq                               # Return
```

```
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
00000000000400550 <mult2>:
 400550: mov     %rdi,%rax           # a
 400553: imul    %rsi,%rax           # a * b
 400557: retq                               # Return
```

Procedure Control Flow

- Use stack to support procedure call and return
- **Procedure call:** `call label`
 - Push return address on stack
 - Jump to label
- **Return address:**
 - Address of the next instruction right after call
 - Example from disassembly
- **Procedure return:** `ret`
 - Pop **code** address from stack
 - Jump to address, resume execution there

Control Flow Example #1

```
00000000000400540 <multstore>:
```

```
•  
•  
•  
•  
•
```

```
400544: callq 400550 <mult2>  
400549: mov   %rax, (%rbx)
```

```
00000000000400550 <mult2>:
```

```
400550: mov   %rdi, %rax  
•  
•  
400557: retq

Procedure Data Flow

Registers

■ First 6 arguments

■ Return value

Stack

■ Only allocate stack space when needed

Data Flow Examples

```
void multstore
(long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

```
0000000000400540 <multstore>:
    # x in %rdi, y in %rsi, dest in %rdx
    . . .
400541: mov     %rdx,%rbx        # Save dest
400544: callq   400550 <mult2>     # mult2(x,y)
    # t in %rax
400549: mov     %rax, (%rbx)       # Save at dest
    . . .
```

```
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
0000000000400550 <mult2>:
    # a in %rdi, b in %rsi
400550: mov     %rdi,%rax        # a
400553: imul    %rsi,%rax        # a * b
    # s in %rax
400557: retq                               # Return
```

Stack-Based Languages

■ Languages that support recursion

- e.g., C, Pascal, Java
- Code must be “Reentrant”
 - Multiple simultaneous instantiations of single procedure
- Need some place to store state of each instantiation
 - Arguments
 - Local variables
 - Return pointer

■ Stack discipline

- State for given procedure needed for limited time
 - From when it's called to when it returns
- Callee returns before caller does (strictly nested calls)

■ Stack allocated in **Frames**

- state for single procedure instantiation

Call Chain Example

```
yoo (...)  
{  
  .  
  .  
  who ();  
  .  
  .  
}
```

```
who (...)  
{  
  . . .  
  amI ();  
  . . .  
  amI ();  
  . . .  
}
```

```
amI (...)  
{  
  .  
  .  
  amI ();  
  .  
  .  
}
```

Procedure `amI ()` is recursive

Example
Call Chain

Stack Frames

■ Contents

- Return information
- Local storage (if needed)
- Temporary space (if needed)

Frame Pointer: `%rbp`
(Optional)

Stack Pointer: `%rsp`

■ Management

- Space allocated when enter procedure
 - “Set-up” code
 - Includes push by **`call`** instruction
- Deallocated when return
 - “Finish” code
 - Includes pop by **`ret`** instruction

Example

```
yoo (...)  
{  
  .  
  .  
  who ();  
  .  
  .  
}
```

```
yoo  
  ↓  
who  
  ↓  ↘  
amI  amI  
  ↓  
amI  
  ↓  
amI
```

Example

Example

Example

Example

Example

Example

Example

Example

Example

Example

x86-64/Linux Stack Frame

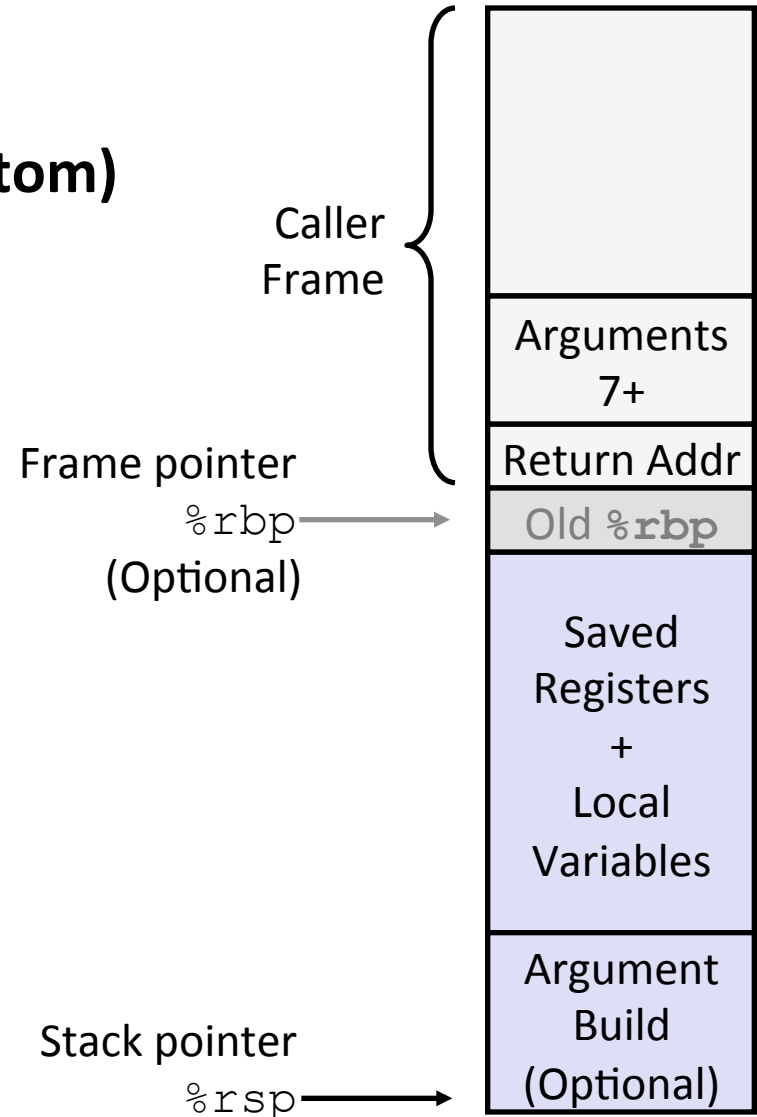

Scenario: Caller called a function

■ Current Stack Frame (“Top” to Bottom)

- “Argument build:”
Parameters for function about to call
- Local variables
If can’t keep in registers
- Saved register context
- Old frame pointer (optional)

■ Caller Stack Frame

- Return address
 - Pushed by `call` instruction
- Arguments for this call

Example: `incr` (will be called on next slide)

```
long incr(long *p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

```
incr:  
    movq    (%rdi), %rax  
    addq    %rax, %rsi  
    movq    %rsi, (%rdi)  
    ret
```

Register	Use(s)
%rdi	Argument <code>p</code>
%rsi	Argument <code>val</code> , <code>y</code>
%rax	<code>x</code> , Return value

Example: Calling `incr` #1

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Initial Stack Structure

Resulting Stack Structure

Example: Calling `incr` #2

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack Structure

Register	Use(s)
<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	3000

Example: Calling `incr` #3

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack Structure

Register	Use(s)
<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	<code>3000</code>

Example: Calling `incr` #4

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack Structure

Register	Use(s)
<code>%rax</code>	Return value

Updated Stack Structure

Example: Calling `incr` #5

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Updated Stack Structure

Register	Use(s)
<code>%rax</code>	Return value

Final Stack Structure

Register Saving Conventions

■ When procedure `yoo` calls `who`:

- `yoo` is the **caller**
- `who` is the **callee**

■ Can register be used for temporary storage?

```
yoo:
    . . .
    movq $15213, %rdx
    call who
    addq %rdx, %rax
    . . .
    ret
```

```
who:
    . . .
    subq $18213, %rdx
    . . .
    ret
```

- Contents of register `%rdx` overwritten by `who`
- This could be trouble → something should be done!
 - Need some coordination

Register Saving Conventions

- “Caller Saved”
 - Caller saves temporary values in its frame before the call
- “Callee Saved”
 - Callee saves temporary values in its frame before using
 - Callee restores them before returning to caller

x86-64 Linux Register Usage #1

■ **%rax**

- Return value
- Also caller-saved
- Can be modified by procedure

■ **%rdi, ..., %r9**

- Arguments
- Also caller-saved
- Can be modified by procedure

■ **%r10, %r11**

- Caller-saved
- Can be modified by procedure

Return value

Arguments

Caller-saved
temporaries

Caller-saved

x86-64 Linux Register Usage #2

■ **%rbx, %r12, %r13, %r14**

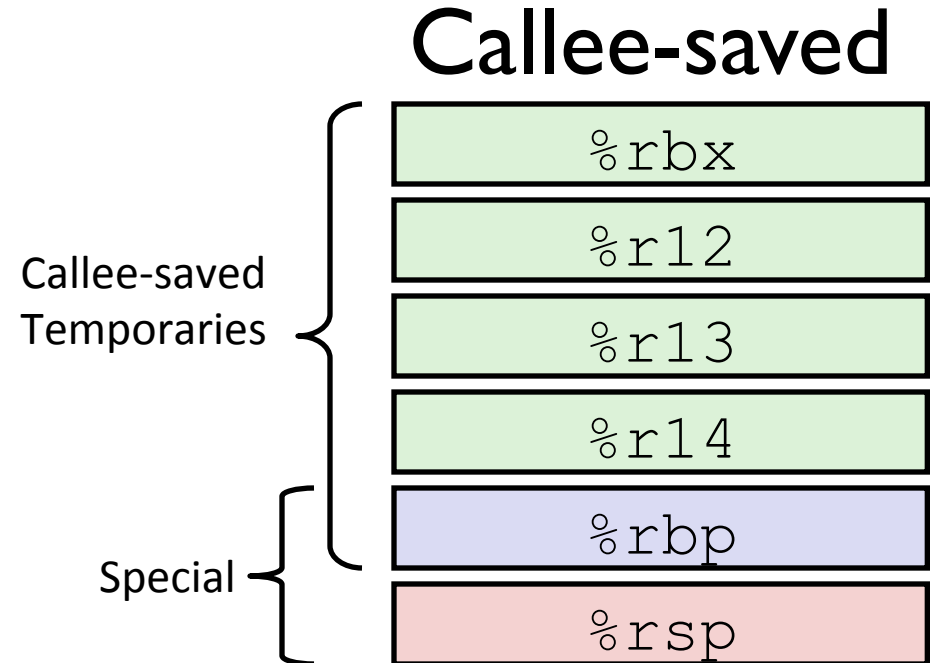

- Callee-saved
- Callee must save & restore

■ **%rbp**

- Callee-saved
- Callee must save & restore
- May be used as frame pointer
- Can mix & match

■ **%rsp**

- Special form of callee save
- Restored to original value upon exit from procedure

Implications of register saving

■ If a function never calls other functions

- Then caller-save registers are convenient; you would need to save them if you wanted their contents preserved from before to after a call of some other function, but that's not happening this time.

■ If a function does call other functions

- Then callee-save registers are convenient; you are assured that whatever function you call will carefully preserve their value from beginning to end of the call, as if they never modified it.

Callee-Saved Example #1

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    subq     $16, %rsp  
    movq     %rdi, %rbx  
    movq     $15213, 8(%rsp)  
    movl     $3000, %esi  
    leaq     8(%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $16, %rsp  
    popq     %rbx  
    ret
```

Initial Stack Structure

Resulting Stack Structure

Callee-Saved Example #2

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    subq     $16, %rsp  
    movq     %rdi, %rbx  
    movq     $15213, 8(%rsp)  
    movl     $3000, %esi  
    leaq     8(%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $16, %rsp  
    popq     %rbx  
    ret
```

Resulting Stack Structure

Pre-return Stack Structure

Today

■ Procedures

- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustration of Recursion

Recursive Function

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Recursive Function Terminal Case

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rdi	x	Argument
%rax	Return value	Return value

Recursive Function Register Save

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rdi	x	Argument

Recursive Function Call Setup

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rdi	x >> 1	Rec. argument
%rbx	x & 1	Callee-saved

Recursive Function Call

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rbx	x & 1	Callee-saved
%rax	Recursive call return value	

Recursive Function Result

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rbx	x & 1	Callee-saved
%rax	Return value	

Recursive Function Completion

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rax	Return value	Return value

Observations About Recursion

■ Handled Without Special Consideration

- Stack frames mean that each function call has private storage
 - Saved registers & local variables
 - Saved return pointer
- Register saving conventions prevent one function call from corrupting another's data
 - Unless the C code explicitly does so (e.g., buffer overflow)
- Stack discipline follows call / return pattern
 - If P calls Q, then Q returns before P
 - Last-In, First-Out. It's a stack of frames.

■ Also works for mutual recursion

- P calls Q; Q calls P

x86-64 Procedure Summary

■ Important Points

- Stack is the right data structure for procedure call / return
 - If P calls Q, then Q returns before P

■ Recursion (& mutual recursion) handled by normal calling conventions

- Can safely store values in local stack frame and in callee-saved registers
- Put function arguments at top of stack
- Result return in `%rax`

■ Pointers are addresses of values

- On stack or global
